

# CS 331: Artificial Intelligence

## Intelligent Agents

1

### General Properties of AI Systems

This part is called an **agent**.

**Agent:** anything that perceives its environment through sensors and acts on that environment through actuators

2

## Example: Vacuum Cleaner Agent

Percept Sequence	Action
[A, Clean]	Right
[A, Dirty]	Suck
[B, Clean]	Left
[B, Dirty]	Suck
[A, Clean],[A, Clean]	Right
[A, Clean],[A, Dirty]	Suck
:	:
[A, Clean], [A, Clean], [A, Clean]	Right
[A, Clean], [A, Clean], [A, Dirty]	Suck
:	:

## Agent-Related Terms

- **Percept sequence:** A complete history of everything the agent has ever perceived. Think of this as the state of the world from the agent's perspective.
- **Agent function (or Policy):** Maps percept sequence to action (determines agent behavior)
- **Agent program:** Implements the agent function

## Question

What's the difference between the **agent function** and the **agent program**?

5

## Rationality

- Rationality: do the action that causes the agent to be most successful
- How do you define success? Need a performance measure
- Eg. reward agent with one point for each clean square at each time step (could penalize for costs and noise)

Important point: Design performance measures according to what one wants in the environment, not according to how one thinks the agent should behave

6

## Rationality

Rationality depends on 4 things:

1. Performance measure of success
2. Agent's prior knowledge of environment
3. Actions agent can perform
4. Agent's percept sequence to date

**Rational agent:** for each possible percept sequence, a rational agent should select an action that is expected to maximize its performance measure, given the evidence provided by the percept sequence and whatever built-in knowledge the agent has

7

## Learning

Successful agents split task of computing policy in 3 periods:

1. Initially, designers compute some prior knowledge to include in policy
2. When deciding its next action, agent does some computation
3. Agent learns from experience to modify its behavior

**Autonomous** agents: Learn from experience to compensate for partial or incorrect prior knowledge

8

# PEAS Descriptions of Task Environments

Performance, Environment, Actuators, Sensors

Example: Automated taxi driver

Performance Measure	Environment	Actuators	Sensors
Safe, fast, legal, comfortable trip, maximize profits	Roads, other pedestrians, customers	Steering, accelerator, brake, signal, horn, display	Cameras, sonar, speedometer, GPS, odometer, accelerometer, engine sensors, keyboard

9

## Properties of Environments

<b>Fully observable:</b> can access complete state of environment at each point in time	vs	<b>Partially observable:</b> could be due to noisy, inaccurate or incomplete sensor data
<b>Deterministic:</b> if next state of the environment completely determined by current state and agent's action	vs	<b>Stochastic:</b> a partially observable environment can appear to be stochastic. ( <b>Strategic:</b> environment is deterministic except for actions of other agents)
<b>Episodic:</b> agent's experience divided into independent, atomic episodes in which agent perceives and performs a single action in each episode.	Vs	<b>Sequential:</b> current decision affects all future decisions
<b>Static:</b> agent doesn't need to keep sensing while decides what action to take, doesn't need to worry about time	vs	<b>Dynamic:</b> environment changes while agent is thinking ( <b>Semidynamic:</b> environment doesn't change with time but agent's performance does)
<b>Discrete:</b> (note: discrete/continuous distinction applies to states, time, percepts, or actions)	vs	<b>Continuous</b>
<b>Single agent</b>	vs	<b>Multiagent:</b> agents affect each others performance measure – cooperative or competitive

## Examples of task environments

Task Environment	Observable	Deterministic	Episodic	Static	Discrete	Agents
Crossword puzzle	Fully	Deterministic	Sequential	Static	Discrete	Single
Chess with a clock	Fully	Strategic	Sequential	Semi	Discrete	Multi
Poker	Partially	Stochastic	Sequential	Static	Discrete	Multi
Backgammon	Fully	Stochastic	Sequential	Static	Discrete	Multi
Taxi driving	Partially	Stochastic	Sequential	Dynamic	Continuous	Multi
Medical diagnosis	Partially	Stochastic	Sequential	Dynamic	Continuous	Multi
Image analysis	Fully	Deterministic	Episodic	Semi	Continuous	Single
Part-picking robot	Partially	Stochastic	Episodic	Semi	Continuous	Single
Refinery controller	Partially	Stochastic	Sequential	Dynamic	Continuous	Single
Interactive English tutor	Partially	Stochastic	Sequential	Dynamic	Discrete	Multi

## Agent Programs

- Agent program: implements the policy
- Simplest agent program is a table-driven agent

```

function TABLE-DRIVEN-AGENT(percept) returns an action
    static: percepts, a sequence, initially empty
             table, a table of actions, indexed by percept sequences, initially
                fully specific
    append percept to the end of percepts
    action ← LOOKUP(percepts, table)
    return action
  
```

This is a BIG table...clearly not feasible!

## 4 Kinds of Agent Programs

- Simplex reflex agents
- Model-based reflex agents
- Goal-based agents
- Utility-based agents

13

## Simple Reflex Agent

- Selects actions using only the current percept
- Works on condition-action rules:  
**if** *condition* **then** *action*

```
function SIMPLE-REFLEX-AGENT(percept) returns an action
  static: rules, a set of condition-action rules

  state ← INTERPRET-INPUT(percept)
  rule ← RULE-MATCH(state, rules)
  action ← RULE-ACTION[rule]
  return action
```

14

## Simple Reflex Agents

15

## Simple Reflex Agents

- Advantages:
  - Easy to implement
  - Uses much less memory than the table-driven agent
- Disadvantages:
  - Will only work correctly if the environment is fully observable
  - Infinite loops

16

## Model-based Reflex Agents

- Maintain some internal state that keeps track of the part of the world it can't see now
- Needs model (encodes knowledge about how the world works)

```
function REFLEX-AGENT-WITH-STATE(percept) returns an action
```

```
  static: state, a description of the current world state
```

```
          rules, a set of condition-action rules
```

```
          action, the most recent action, initially none
```

```
  state ← UPDATE-STATE(state, action, percept)
```

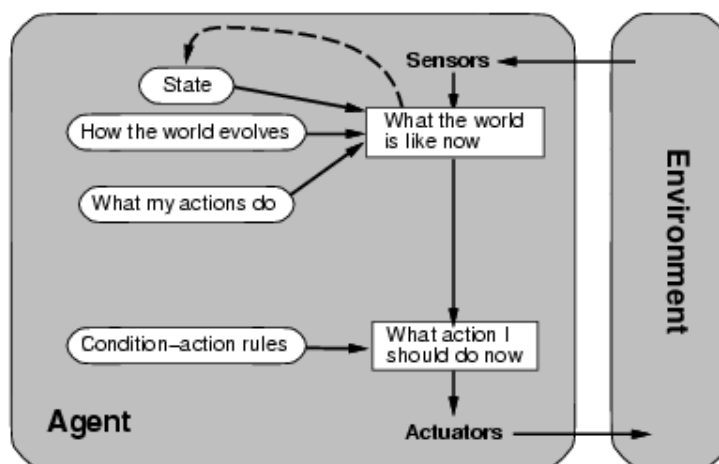

```
  rule ← RULE-MATCH(state, rules)
```

```
  action ← RULE-ACTION[rule]
```

```
  return action
```

17

## Model-based Reflex Agents

18

## Goal-based Agents

- Goal information guides agent's actions (looks to the future)
- Sometimes achieving goal is simple e.g. from a single action
- Other times, goal requires reasoning about long sequences of actions
- Flexible: simply reprogram the agent by changing goals

19

## Goal-based Agents

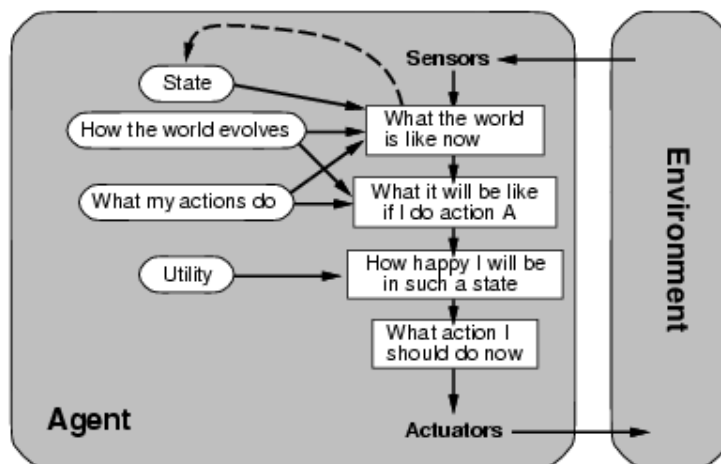

20

## Utility-based Agents

- What if there are many paths to the goal?
- Utility measures which states are preferable to other state
- Maps state to real number (utility or “happiness”)

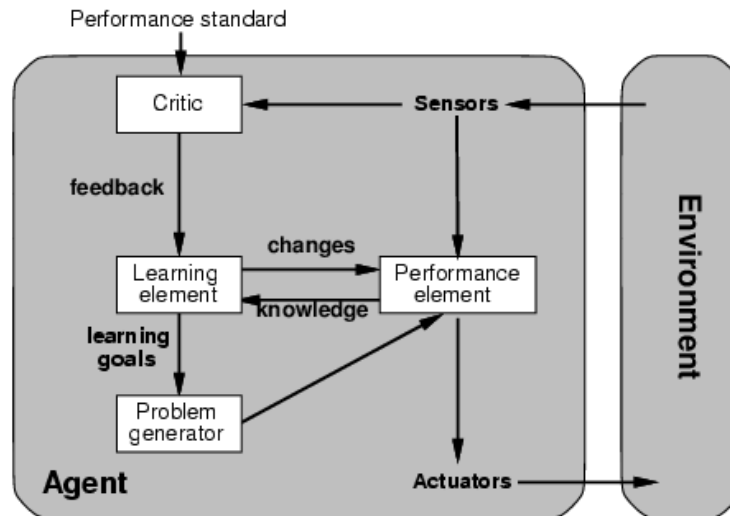

21

## Utility-based Agents

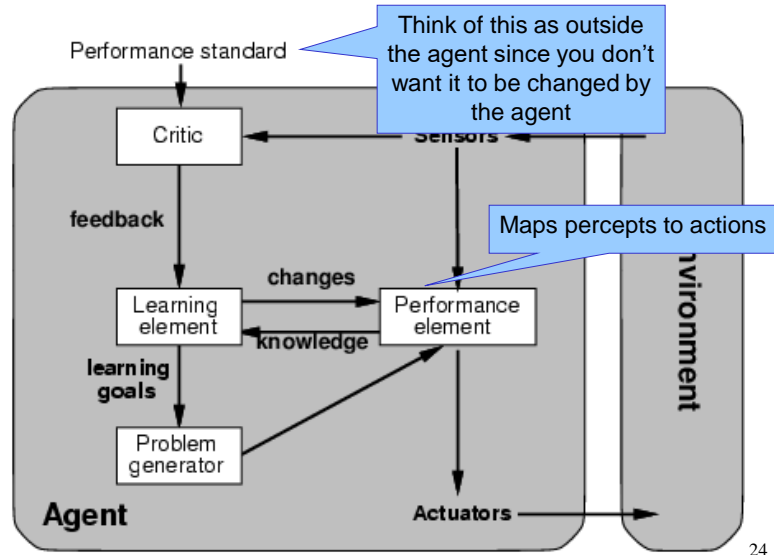

22

# Learning Agents

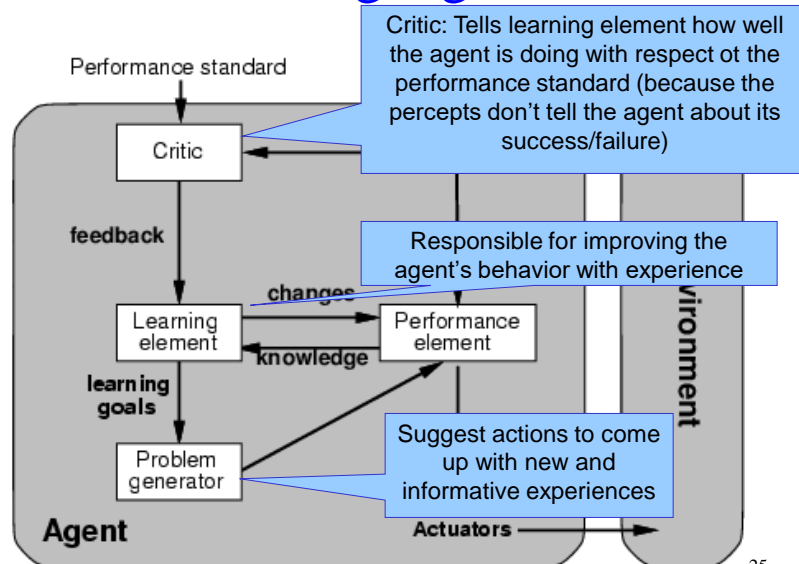

23

# Learning Agents

24

## Learning Agents

## What you should know

- What it means to be rational
- Be able to do a PEAS description of a task environment
- Be able to determine the properties of a task environment
- Know which agent program is appropriate for your task

## In-class Exercise

Develop a PEAS description of the task environment for a movie recommendation agent

Performance Measure	
Environment	
Actuators	
Sensors	

27

## In-class Exercise

Describe the task environment

Fully Observable	Partially Observable
Deterministic	Stochastic
Episodic	Sequential
Static	Dynamic
Discrete	Continuous
Single agent	Multi-agent

28

## In-class Exercise

- Select a suitable agent design for the movie recommendation agent

29
